

Help Loukas Find the Vermilion Palace

Can you find your way through the crazy maze below?

Directions for the Maze:

Stop reading the story *Loukas and the Game of Chance* when Loukas loses the card game and decides to travel through the forest to search for Destiny in the vermilion palace.

Stop right at the moment Loukas is about to enter the forest. Think! Write!

On his journey to find Destiny in the vermilion palace, who might Loukas meet in the forest? What people, animals, creatures, strange folks, and mysterious things might he see or actually talk with? What might the forest itself look like? Its trees? Its lakes, creeks, and streams? Its landscape?

With these questions as your guide, write a story about Loukas's journey through the forest. End your story at the moment he comes upon the vermilion palace. Try for 350 words or more.

Good luck. Enjoy.

Labyrinth Maze

Can you find your way to the other side of the labyrinth? Beware of the minotaur that guards the path, he doesn't like being woken up!

RAPUNZEL'S RESCUE

Can you help the prince reach Rapunzel? Draw a path from the prince to the princess by counting from 1 to 20.

				19	
Rapunzel	11	16	15	14	
	18	17	12	13	
	18	20	19	9	11
	17	11	6	4	10
	3	9	15	8	9
	11	17	6	7	3
	4	10	5	12	1
	16	15	4	3	2

Celtic Maze

In one serpent and out the other! Can you make it?

The serpent is an important magical symbol in Celtic mythology that is connected with healing powers.

Karst

Karst is a type of landscape made when acidic water seeps through cracks in the ground and slowly dissolves **limestone rock** over thousands or millions of years, leaving underground passages and spaces. Karst landscapes attract visitors and explorers, because caves, sinkholes and other interesting features can be found there.

It's a Cave Expedition!

Help the spelunker (or cave explorer) get through the cave maze to the main chamber!

Limestone is a rock that is made of tiny shells, corals, and skeletons of tiny ocean creatures. The limestone that is found on land was formed at the bottom of an ancient ocean!

Caves

A **cave** is a natural underground space that is large enough for people to fit inside. Caves are created through a variety of processes, including the weathering of rock, volcanic activity or landslides.

Label the Formations

There are many different formations in caves, including stalagmites, draperies and flowstone. Most are caused by the slow dripping of water, which over time deposits minerals. Draw a line from the cave formation terms to the correct drawing in the cave to the left.

DRAPERY: looks like stone curtains hanging from the ceiling.

STALACTITE: looks like an icicle made of stone.

COLUMN: these form when a stalactite and stalagmite meet.

STALAGMITE: these are usually thicker than stalactites.

FLOWSTONE: looks like a frozen waterfall.

Memory Booster: stalagmites grow up from the ground and “mite” reach the ceiling, and stalactites hold “tite” to the ceiling!
